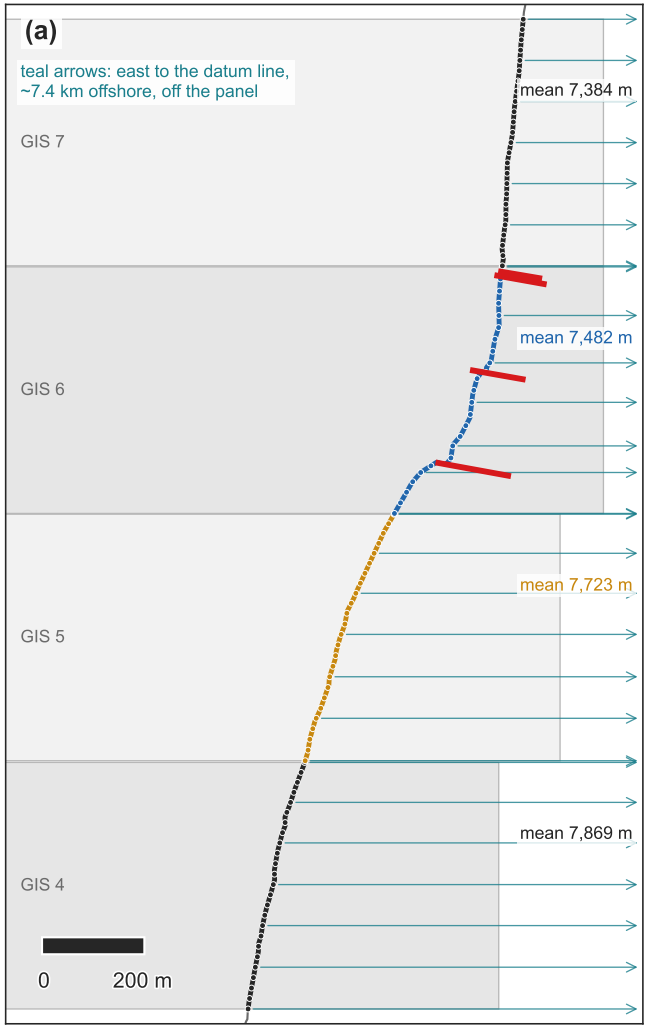
One survey (Oct 1996), GIS 4-7



From a line to a number

(b)

1 Clip	cut the survey's line at each domain's box
2 Sample	25 points evenly along each clipped piece
3 Measure	each point's distance to the offshore datum line, a straight north-south line ~7.4 km east, so the distance runs due east
4 Average	the mean of the 25 distances is the domain's position in that survey
5 Difference	subtract it from the same domain's 1967 value: change since 1967 (here + seaward)
This survey	GIS 6: 7,482 m (1967: 7,433 m) → -49 m GIS 5: 7,723 m (1967: 7,540 m) → -183 m
