Does each version hold sand updrift, and is sand conserved?
What drives the groin
(a)
Net drift (M m³/yr)
BRIE diffusivity (10³ m²/yr, dashed)
zero drift +31 °
Shoreline orientation (°)
Sand held updrift
(b)
Updrift cell after 50 yr (m, seaward +)
Shoreline orientation (°)
The module's own balance
(c)
Sand the module adds, 50 yr (m of summed shoreline)
Shoreline orientation (°)
BRIE's solve
(d)
Sand the solve adds, 50 yr (m of summed shoreline)
Shoreline orientation (°)
Module plus solve
(e)
Total change in the reach, 50 yr (m of summed shoreline)
Shoreline orientation (°)
Source/sink (dipole)
Trapping, pinned
Trapping, conserving
Trapping, drift
Trapping, hybrid
Trapping, corrected
net drift toward the groin (a)
BRIE diffusivity (a)
diffusivity at or below zero: coast frozen (a)
